

# AKS storage using Shared Disk & Availability Zones

Houssem Dellai

Azure Disk, by default LRS, is zonal resource.

Azure Disk could be ZRS, available in multiple Availability Zones.

Azure Disk, by default, is mounted to one single virtual machine.

Well, not anymore with **Shared Disk**.

# Shared Disks with AKS

Mounted to more than one node simultaneously

Use ReadWriteMany (RWX) accessMode and Raw Block Device with Block volumeMode

One single node can write at a time

Container will see a device instead of a file system

Can be used with applications that can manage writes, reads, locks, caches, fencing on raw block volumes

Can be used with PPG for lowest latency

Supports Ultra Disk, Premium SSD & Standard SSD

Supports LRS and ZRS disks

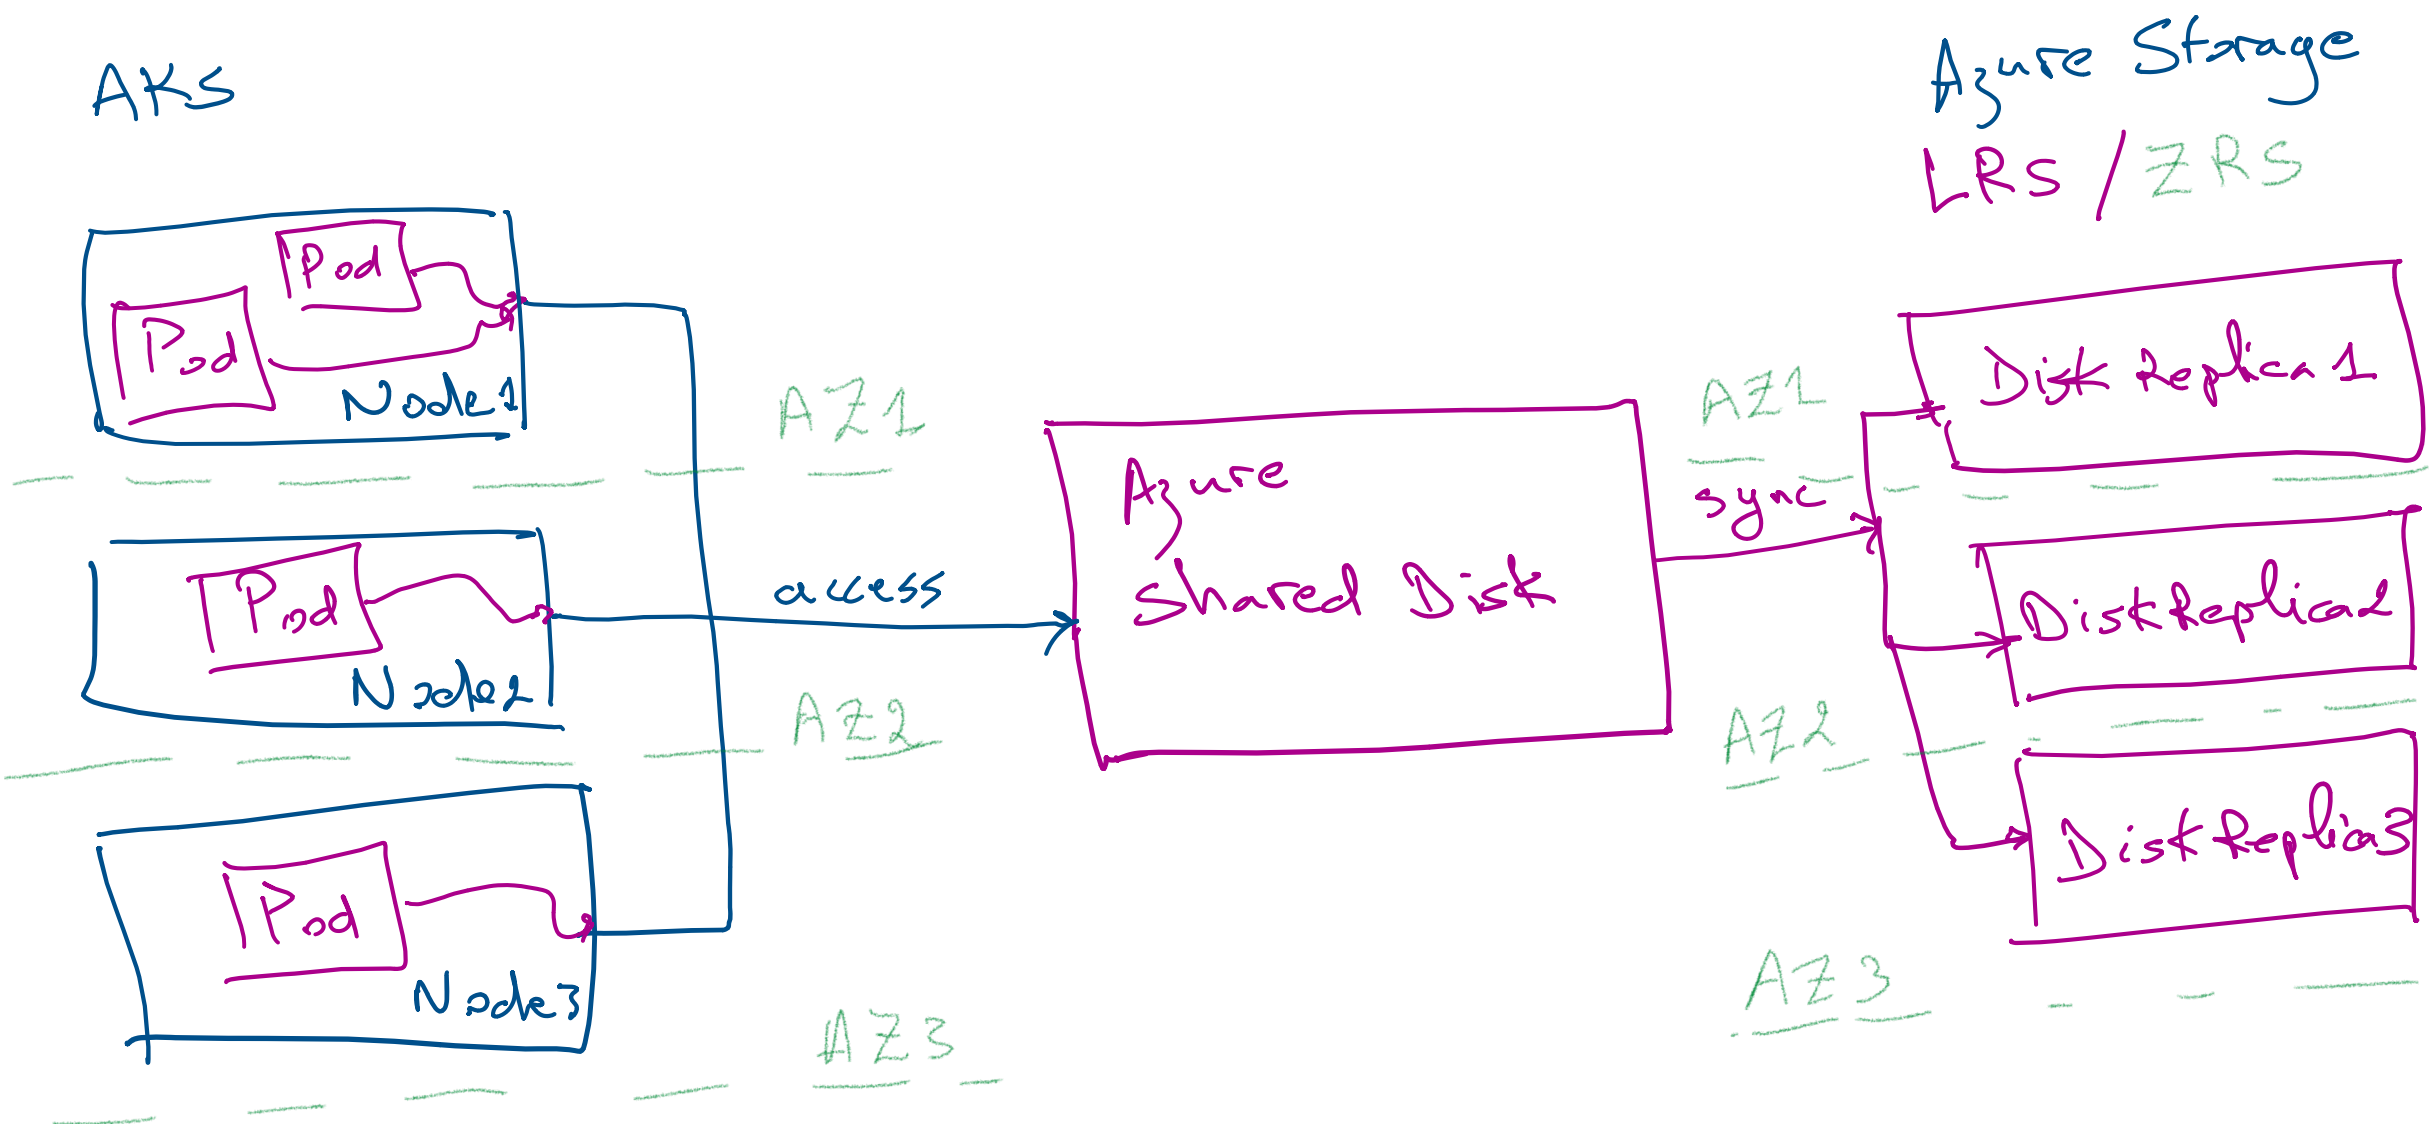

# ZRS disk attached to clustered VMs and shared

Using Availability Zones for VMs, you can allocate primary and secondary VMs in different zones for higher availability and attach a shared ZRS disk to the VMs in different zones.

# How shared disk works

```

apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: zrs-shared-managed-csi
provisioner: disk.csi.azure.com
parameters:
  skuName: Premium_ZRS
  maxShares: "2"
  cachingMode: None # N/A with maxShares>1
reclaimPolicy: Delete
---
kind: PersistentVolumeClaim
